ERP System Data Privacy & Security Checklist

Dear Mr. George,

Following our review of your ERP system's data privacy and security, please use this checklist to ensure the necessary improvements are made.

Security & Compliance Checklist

☐ **Sitemap & Robots.txt Configuration**

- Ensure your developer has configured the sitemap and `robots.txt` file to prevent unnecessary crawling by search engines, reducing the risk of exposing sensitive system data.

☐ **M-Pesa Integration**

- Register your URL with M-Pesa to enable seamless online and offline transactions, ensuring smooth payment processing for your customers.

☐ **SSL Certificate Implementation**

- Your customer ordering site and ERP system currently lack an SSL certificate, making them vulnerable.
- If possible, request or purchase an SSL certificate from your website hosting provider. Generally, the cost ranges from **KES 1,500**.
- An SSL certificate is essential for securing user data and building customer trust.

☐ **Website Security**

- The absence of an SSL certificate indicates that your site is not secure. Addressing this will enhance security and improve compliance with data protection standards.

☐ **Mail & SMS Configuration**

- Properly configure your email and SMS services to ensure secure communication and protect customer privacy.

☐ **Database Security & Upgrade**

- We noticed an issue with the **database type** you are using. While it is functional, it has vulnerabilities that could pose a security risk.
- We recommend reviewing your database setup and upgrading if necessary.

SERVETECH Systems

- Kindly consult your website hosting provider, as a database upgrade or migration typically costs **between KES 1,000 and 2,000**.
- This is a cost-effective measure to enhance security and system stability.
